

2012 年概率论与数理统计试卷 (A 卷) 参考解答

一、填空题

1、由加法公式 $P(\bar{A} \cup B) = P(\bar{A}) + P(B) - P(\bar{A}B) = 1 - P(A) + P(B) - P(\bar{A}B)$

由乘法公式 $P(\bar{A}B) = P(B)P(\bar{A} | B) = P(B)[1 - P(A | B)]$

所以 $P(\bar{A} \cup B) = 1 - P(A) + P(B) - P(B)[1 - P(A | B)] = 1 - P(A) + P(B)P(A | B)$
 $= 1 - 0.6 + 0.4 \times 0.5 = 0.6$

2、 $P(K^2 - K - 2 \geq 0) = P(K \geq 2) + P(K \leq -1)$

而 $P(K \geq 2) = \int_2^{+\infty} e^{-x} dx = e^{-2}$, $P(K \leq -1) = 0$

所以 $P(K^2 - K - 2 \geq 0) = e^{-2}$

3、由于 $X \sim \pi(\lambda)$, 所以 $E(X) = D(X) = \lambda$

$E[(X-1)(X-2)] = E[X^2 - 3X + 2] = E(X^2) - 3E(X) + 2$

由公式 $E(X^2) = D(X) + E^2(X)$,

$E[(X-1)(X-2)] = D(X) + E^2(X) - 3E(X) + 2 = \lambda^2 - 2\lambda + 2 = 1$

解得 $\lambda = 1$

4、由 $X \sim U(0,1)$, 得 $D(X) = \frac{1^2}{12}$, $Y \sim \pi(0.3)$, 得 $D(Y) = 0.3$,

由 $Cov(X, Y) = \rho_{XY} \sqrt{D(X)} \sqrt{D(Y)} = \frac{1}{4} \sqrt{\frac{1}{12}} \sqrt{0.3} = \frac{1}{8\sqrt{10}}$

5、 $X^2 \sim \chi^2(1), Y^2 \sim \chi^2(1)$, 由 F 分布定义, $X^2 / Y^2 \sim F(1,1)$

6、 $\left(\bar{x} - \frac{s}{\sqrt{n}} t_{\alpha/2}(n-1), \bar{x} + \frac{s}{\sqrt{n}} t_{\alpha/2}(n-1) \right), \left(\bar{x} - \frac{\sigma}{\sqrt{n}} z_{\alpha/2}, \bar{x} + \frac{\sigma}{\sqrt{n}} z_{\alpha/2} \right)$

二、见课本 26 页 21 题

三、解: X 的概率密度函数为 $f(x) = \begin{cases} \frac{1}{5} e^{-\frac{x}{5}}, & x > 0 \\ 0, & x \leq 0 \end{cases}$

则王大爷在银行未等到服务的概率 $p = P(X > 10) = \int_{10}^{+\infty} \frac{1}{5} e^{-\frac{x}{5}} dx = e^{-2}$

随机变量 $Y \sim b(5, p) = b(5, e^{-2})$, 所以 Y 的分布律为

$$P\{Y = k\} = C_5^k (e^{-2})^k (1 - e^{-2})^{5-k}, \quad k = 0, 1, 2, 3, 4, 5$$

四、解: (1) $f_X(x) = \int_{-\infty}^{+\infty} f(x, y) dy = \begin{cases} \int_0^2 (x^2 + \frac{1}{3}xy) dy & 0 \leq x \leq 1 \\ 0 & \text{其他} \end{cases} = \begin{cases} 2x^2 + \frac{2}{3}x & 0 \leq x \leq 1 \\ 0 & \text{其他} \end{cases}$

$$f_Y(y) = \int_{-\infty}^{+\infty} f(x, y) dx = \begin{cases} \int_0^1 (x^2 + \frac{1}{3}xy) dx & 0 \leq y \leq 2 \\ 0 & \text{其他} \end{cases} = \begin{cases} \frac{1}{3} + \frac{1}{6}y & 0 \leq y \leq 2 \\ 0 & \text{其他} \end{cases}$$

易见 $f(x, y) \neq f_X(x)f_Y(y)$, 所以 X, Y 不独立

$$(2) P(X + Y \geq 1) = 1 - P(X + Y < 1) = 1 - \iint_{x+y < 1} f(x, y) dx dy$$

$$= 1 - \int_0^1 dx \int_0^{1-x} \left(x^2 + \frac{xy}{3} \right) dy = \frac{65}{72}$$

$$(3) f_{X+Y}(z) = \int_{-\infty}^{+\infty} f(x, z-x) dx$$

当 $0 \leq x \leq 1$ 且 $0 \leq z-x \leq 2$ 时, 被积函数 $f(x, z-x) \neq 0$

即当 $0 \leq x \leq 1$ 且 $z-2 \leq x \leq z$ 时, 被积函数 $f(x, z-x) \neq 0$

所以,

$$f_{X+Y}(z) = \int_{-\infty}^{+\infty} f(x, z-x) dx = \begin{cases} \int_0^z \frac{2x^2 + xz}{3} dx = \frac{7}{18} z^3 & 0 \leq z < 1 \\ \int_0^1 \frac{2x^2 + xz}{3} dx = \frac{2}{9} + \frac{z}{6} & 1 \leq z < 2 \\ \int_{z-2}^1 \frac{2x^2 + xz}{3} dx = \frac{(z-2)^2(8-z) + 3z + 4}{18} & 2 \leq z < 3 \\ 0 & \text{其他} \end{cases}$$

五、解:

$$E(X) = \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} xf(x, y) dx dy = \int_0^1 dx \int_0^1 x(x+y) dy = \int_0^1 (x^2 + \frac{1}{2}x) dx = \frac{7}{12}$$

$$E(X^2) = \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} x^2 f(x, y) dx dy = \int_0^1 dx \int_0^1 x^2(x+y) dy = \int_0^1 (x^3 + \frac{1}{2}x^2) dx = \frac{5}{12}$$

$$E(Y) = \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} yf(x, y) dx dy = \int_0^1 dx \int_0^1 y(x+y) dy = \int_0^1 (\frac{1}{3} + \frac{1}{2}x) dx = \frac{7}{12}$$

$$E(XY) = \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} xyf(x, y) dx dy = \int_0^1 dx \int_0^1 xy(x+y) dy = \int_0^1 (\frac{1}{3}x + \frac{1}{2}x^2) dx = \frac{1}{3}$$

$$D(X) = E(X^2) - E^2(X) = \frac{5}{12} - \left(\frac{7}{12}\right)^2 = -\frac{1}{6}$$

$$\text{Cov}(X, Y) = E(XY) - E(X)E(Y) = \frac{1}{3} - \left(\frac{7}{12}\right)^2 = -\frac{1}{144}$$

六、见课本 126 页 2 (1) 题

七、解：

$$\text{总体一阶矩 } \mu_1 = E(X) = \int_{-\infty}^{+\infty} xf(x)dx = \int_0^\theta \frac{6x^2}{\theta^3}(\theta - x)dx = \frac{\theta}{2}$$

反解 $\theta = 2\mu_1$ ，用样本矩 A_1 代替总体矩 μ_1 ，得到估计量 $\bar{\theta} = 2A_1 = 2\bar{X}$

$$D(\bar{\theta}) = D(2\bar{X}) = 4D(\bar{X}) = \frac{4\sigma^2}{n}$$

$$E(X^2) = \int_{-\infty}^{+\infty} x^2 f(x)dx = \int_0^\theta \frac{6x^3}{\theta^3}(\theta - x)dx = \frac{3}{10}\theta^2$$

$$\sigma^2 = E(X^2) - E^2(X) = \frac{3}{10}\theta^2 - \frac{\theta^2}{4} = \frac{\theta^2}{20}$$

$$\text{所以 } D(\bar{\theta}) = \frac{4\sigma^2}{n} = \frac{\sigma^2}{5n}$$

八、解：

$$\text{似然函数为 } L(x_1, x_2, \dots, x_n, \theta) = \prod_{i=1}^n \frac{1}{\theta} e^{-\frac{x_i}{\theta}}$$

$$\text{取对数 } \ln L(x_1, x_2, \dots, x_n, \theta) = \sum_{i=1}^n \left(\ln \frac{1}{\theta} - \frac{x_i}{\theta} \right) = \sum_{i=1}^n \left(-\ln \theta - \frac{x_i}{\theta} \right)$$

$$\text{求导数: } \frac{d \ln L(x_1, x_2, \dots, x_n, \theta)}{d\theta} = \sum_{i=1}^n \left(-\frac{1}{\theta} + \frac{x_i}{\theta^2} \right) = 0$$

$$\text{解得 } \theta = \frac{1}{n} \sum_{i=1}^n x_i = \bar{x}$$

$$\text{最大似然估计量为 } \bar{\theta} = \frac{1}{n} \sum_{i=1}^n X_i = \bar{X}$$

下面证明 $\bar{\theta} = \frac{1}{n} \sum_{i=1}^n X_i = \bar{X}$ 为 θ 的无偏估计

$$E(\bar{\theta}) = E(\bar{X}) = E(X) = \theta$$
